Topic Categories: Purse seine, Tropical tuna

## Abstract

Purse seine vessels account for about 66% of the world's tuna catch. However, the number of purse seiners operating in the various oceans is not available from a single source. In this paper we estimate the number and fishing capacity of authorized tuna purse seiners based primarily on information available from the five tuna Regional Fishery Management Organizations (RFMOs). After accounting for possible duplicate entries, we calculate that as of June 2020 there are at least 1,721 purse seiners fishing for tunas worldwide. This is surely an underestimate because many small-scale purse seiners or purse seiners operating in only one EEZ do not have to be listed on RFMO records of authorized fishing vessels. Focusing on large-scale purse seiners (defined here as having 335 m<sup>3</sup> fish hold volume or greater) that target tropical tunas (skipjack, yellowfin and bigeye), we calculate there are 696 such vessels with a combined fishing capacity of over 874,000 m<sup>3</sup>. The number of these vessels increased by about 1.5% during the past year. Of those 696 large scale purse seine vessels fishing for tropical tunas, 517 are registered on the ISSF Pro Active Vessel Register (PVR), which represent 74% in number and 83% in fish hold volume (FHV). About 17% of these 696 large-scale vessels are authorized to fish in more than one RFMO, which should be taken into account in any efforts to manage fishing capacity at a regional level.

**June 2020**

ISSF is a global coalition of scientists, the tuna industry and World Wildlife Fund (WWF) — the world's leading conservation organization — promoting science-based initiatives for the long-term conservation and sustainable use of tuna stocks, reducing bycatch and promoting ecosystem health. Helping global tuna fisheries meet sustainability criteria to achieve the Marine Stewardship Council certification standard — without conditions — is ISSF's ultimate objective. ISSF receives financial support from charitable foundations and industry sources.

# Research Questions

This study aimed at responding the following questions:

- What is the **current number and capacity of purse seine vessels targeting tuna worldwide?**
- What proportion of that capacity is represented by those **large-scale purse seiners that target exclusively tropical tuna?**
- How has the estimated global capacity **changed since last year?**
- Where are large-scale purse seine vessels targeting tropical tuna **authorized to fish?**
- What is the **trend in flagging changes** between developed-country economies and developing ones?
- How many large-scale purse seine vessels targeting tropical tuna have been **built in the last few years?**

# 1. Introduction

Purse seine fishing vessels catch about 66% of the 4.9 million tonnes of tunas taken annually worldwide (ISSF, 2020). Of the tropical tunas, purse seiners generally target skipjack and yellowfin, though they also catch bigeye tuna associated primarily with floating objects.

In recent years, several authors have estimated the number of vessels and fishing capacity of tropical tuna purse seine fleets either regionally (e.g., Gillett and Lewis, 2003) or globally (Joseph, 2003; Reid et al., 2005; Restrepo and Forrestal, 2012; Justel-Rubio and Restrepo, 2014, 2015, and 2016; Justel-Rubio *et al.*, 2017, 2018, and Justel-Rubio and Recio, 2019). The aim of this paper is to provide an updated "snapshot" of the purse seine fleet as of June 2020 based primarily on the records of authorized vessels established by the five tuna RFMOs, as in Restrepo and Forrestal (2012) and all subsequent versions of this study. Some of the key factors taken into consideration in this series of studies are new vessels that are launched and improvements to the data contained in the RFMO records.

## 2. Methods

The Glossary ([Appendix 1](#)) defines acronyms used in this document.

We generally used the same sources of information and methodology as in the 2019 snapshot (Justel-Rubio and Recio, 2019). Vessel registers from all tuna RFMOs were consulted, as well as the International Handling Services (IHS) Sea-Web database (IMO number database) and the FFA [List of Vessels in Good Standing](#). For this update, we also consulted the five tuna RFMO Consolidated List of Authorized Vessels ([CLAV](#)).

The following steps were taken to compile the list of vessels:

1. Retrieve the CCSBT, IATTC, ICCAT, IOTC and WCPFC lists and select purse seine vessels only.
2. Identify duplicates. This involved sorting by IMO, or by Flag and then by name, and manually identifying vessels of the same name or similar name (e.g., "No. 8 XXX" and "XXX No. 8") and the same characteristics such as size or radio call sign. The CLAV was consulted as needed.
3. Fill in missing fields (hold volume, fish carrying capacity, LOA) when data were available from the IHS Sea-Web database or FFA.
4. Set LOA: If several vessel size measurements were available, LOA was set to the largest value. This is because usually either LOA or LBP, or both, are reported in the RFMO lists and LOA>LBP.
5. Set GRT: If several vessel tonnage values were available, GRT was set to the smallest value. This is because usually GRT and GT are recorded in the lists and GRT<GT.
6. Use relationships between different vessel attributes to calculate FHV for all vessels without that information (see [Sections 3.1](#) and [3.2](#)).
7. Determine large-scale purse seine vessels and quantify them by Flag, including FHV estimates.
8. Identify a subset of those large-scale vessels that likely target tropical tunas and quantify them.

All records from the previous version of the database were verified with updated versions of the tRFMO databases and missing values completed with the supporting databases available (IHS Sea-Web database, FFA Vessels in Good Standing). A standard procedure was applied to identify possible duplicate records. Length measures were again divided in LOA, LBP and RGL; and Gross Tonnage data grouped in GRT and GT.

For steps 6 and 7 we used the relationships between vessel attributes calculated using the likelihood-based approach of the 2016 snapshot (Justel-Rubio and Restrepo, 2016) (described in [Appendix 2](#)). These relationships are used to categorize Large-Scale purse seine vessels following the ISSF definition, that is, purse seine vessels with  $\geq 335 \text{ m}^3$  of capacity (fish hold volume, FHV). Taking into consideration the goodness of fit (the measure of how well the response variable is explained by the model) of the various relationships, LOA and FHV missing values were estimated in this order:

1. Fill in LOA:  
If GT is available, then use the **GT-LOA** relationship.  
If GT is not available but GRT is, then use the **GRT-LOA** relationship.
2. Fill in FHV:  
If FCC is available, use the **FHV-FCC** relationship.  
Otherwise, use the **FHV-LOA** relationship.

Note that, with the aim of improving the reliability of FHV estimates, the relationships between FHV and other variables (FHV-FCC, FHV-LOA) are those calculated by [Restrepo and Justel-Rubio \(2016\)](#), which were based only in a subset of vessels listed at the Inter-American Tropical Tuna Commission (IATTC) Record as of April 2016. The reason to do so is that the IATTC has been the only tRFMO to verify vessels' reported FHV values up to January 2017. A more detailed explanation on the calculation of FHV for tuna purse seine vessels following a maximum likelihood approach can be found in [ISSF Technical Report 2016-10](#) (Restrepo and Justel-Rubio, 2016).

In doing the analyses, we realised that some vessels are now flagged to countries that did not appear in the last snapshot (Justel-Rubio and Recio, 2019), and some vessel flags are no longer represented in the list of currently active vessels. We

therefore updated the list of countries according to the International Monetary Fund's (IMF) April 2020 World Economic Outlook<sup>1</sup>, in two broad IMF groupings: "Advanced Economies" (Developed) and "Emerging and Developing Economies" (Other). **Table 1** summarizes the flag codes and development status of the flag states used in this paper.

**Table 1.** Flag codes used in this paper. The column Economy indicates whether a given flag was treated as a developed economy in this study.

## 3. Results and Discussion

### 3.1. Global list of authorized purse seine vessels

Merging the RFMO lists, selecting purse seine vessels only and identifying likely duplicates, resulted in a total of 1,721 vessels. This is 7% less than the 1,843 purse seiners in Justel-Rubio and Recio (2019) and is mainly due to the removal of vessels from the ICCAT authorized vessel record. These were mostly small and medium-sized vessels (under 30 m LOA), many of them targeting eastern Atlantic and Mediterranean bluefin tuna, that have been delisted from ICCAT's vessel record or are now listed as inactive or inoperative. There may be other causes for changes in the number of purse seine vessels, such as changes in vessel type as reported to the RFMOs (for example, fish carriers and support vessels are sometimes listed as purse seiners and vice versa), or vessels that have sunk or been scrapped.

After following steps 3-5 outlined above in Section 2, and updating the vessels' information with the most recent tRFMO vessel records and supporting databases, the resulting database contained information as follows (the percentage of vessels with complete information is shown):

Data field	v1.0 (2012)	v2.0 (2014)	v3.0 (2015)	v4.0 (2016)	v5.0 (2017)	v6.0 (2018)	v7.0 (2019)	V8.0 (2020, this study)
LOA	83%	82%	85%	84%	94%	94%	95%	96%
GRT	76%	57%	47%	43%	52%	52%	49%	49%
GT	N/A	48%	57%	61%	56%	61%	61%	62%
FHV	33%	47%	30%	36%	35%	35%	35%	39%
FCC	19%	33%	23%	29%	28%	28%	28%	31%

In terms of vessel sizes, the available data showed a bi-modal distribution (**Figure 1**), with a high peak at around 22.5 meters and a second, much less pronounced mode, at around 72.5 meters (LOA). Vessel sizes ranged from 7.1 to 116 meters LOA. There is a large drop in the frequency of registered vessels below 20 m because most RFMOs generally do not require registration below this size.

**Figure 1.** Distribution of purse seine vessel sizes (LOA in m) in the RFMO vessel records.

### 3.2. Filling in missing values

The following missing values were filled using the relationships as described in [Section 2](#). For full details of the relationships used, see [Appendix 2](#).

1. Fill in LOA  
Using the **GT-LOA** relationship: done for 57 vessels.  
Using the **GRT-LOA** relationship: done for 12 vessels.
2. Fill in FHV  
Using the **FHV-FCC** relationship: done for 130 vessels.  
Using the **FHV-LOA** relationship: done for 928 vessels.

### 3.3. The global tuna purse seine fleet

We found that 1,721 purse seine vessels were authorized by the tRFMOs to fish for tunas in June 2020. We estimate that these 1,721 vessels have a combined FHV of over 1,084,000 m<sup>3</sup>. The distribution by Flag is given in **Table 2**. The ratio of vessels flagged to developing versus developed countries is 2.5:1.0 in number of vessels but about 2.0:1.0 in capacity. Both ratios are similar although higher than those calculated in Justel-Rubio and Recio (2019).

**Table 2.** Distribution of tuna purse seiners (all sizes) by flag as of June 2020. The entries represent the number of vessels and their estimated combined FHV.

### 3.4. The large-scale purse seine tuna fleet

There are many ways to approach the definition or categorization of large-scale fishing vessels. In ISSF Conservation Measures, large-scale purse seiners are considered those with FHV of 335 m<sup>3</sup> or greater, which is the definition we used. Limiting the list to large-scale vessels excluded 934 vessels, resulting in a total of 787 large-scale purse seiners with an overall estimated FHV of ~921,000 m<sup>3</sup> (Table 3). Limiting the list to large-scale vessels removed about 54% of the vessels in numbers — but only removed 15% of the combined hold volume. The Other: Developed ratio of capacity decreased both in terms of FHV and in number of vessels.

**Table 3.** Distribution of large-scale tuna purse seiners ( $\geq 335$  m<sup>3</sup> FHV) by flag as of June 2020. The entries represent the number of vessels and their estimated combined FHV.

### 3.5. The large-scale tropical tuna purse seine tuna fleet

The tRFMO lists include purse seine vessels that fish for bluefin tuna either permanently or sporadically. In addition, the WCPFC record includes purse seiners which operate north of 20°N and do not target tropical tunas year-round.

In consultation with members from the industry and several agencies, the following vessels were excluded:

- Vessels flagged to Mediterranean countries (other than Spain and France);
- Vessels flagged to Spain and France that are only authorized on the ICCAT record and are only authorized to fish bluefin tuna;
- Vessels flagged to Japan that are on the WCPFC record but not on the FFA record.

Removing these resulted in an estimated 696 large-scale, tropical tuna purse seine vessels with a combined hold volume of 874,201 m<sup>3</sup> (**Table 4**). Compared to the list of all large-scale tuna purse seiners above, these correspond to 12% and 5% reductions in number of vessels and aggregate FHV, respectively. The Other: Developed country ratio of capacity is estimated around 2.5:1.0 in vessel numbers and 1.9:1.0 in FHV.

**Table 4.** Distribution of large-scale tropical tuna purse seiners (mostly targeting tropical tunas) by flag as of June 2020. The entries represent the number of vessels and their estimated combined FHV.

Total							696	874,201
Developed							197	297,179
Other							499	577,022
Oth:Dev							2.53	1.94

It is important to note where these 696 vessels are authorized to fish. **Table 5** shows the current number of authorized vessels by RFMO (the diagonal shows the number of authorizations in each RFMO). Seventeen percent of these vessels were registered in more than one tRFMO in June 2020. The largest number of authorizations – 349 – was in the WCPFC. However, several sources suggest that the number of active large-scale tropical tuna vessels in that region is about 250 (e.g., Williams *et al.* 2017). Thus, about 100 vessels despite being authorized to fish in the WCPFC area are either not fishing there or are not required to be listed on the record (note that, in the WCPFC, vessels that fish solely in their own EEZ do not need to be on the WCPFC Record). Most tRFMOs maintain lists of vessels authorized to operate in the Convention Areas, but do not maintain lists of vessels that are actively fishing in the Convention Areas, so it is difficult to estimate active capacity by region at any given time.

**Table 5.** Distribution of large-scale tropical tuna purse seiners ( $\geq 335$  m<sup>3</sup> FHV) registered in tRFMOs.

	CCSBT	IATTC	ICCAT	IOTC	WCPFC
CCSBT	3			3	2
IATTC		231	19	2	31
ICCAT			107	25	31
IOTC				146	49
WCPFC					349

It is also useful to examine flagging changes between developed-country economies (“Developed”) and emerging and developing ones (“Other”). The available data does not always indicate the year of flag change and, therefore, these results reflect changes that took place over several decades. **Table 6** summarizes the available information on these vessels’ previous flags: 136 flag changes (40%) were from developed to developing economies, and 171 (50%) were between developing economies. Relatively fewer flag changes (10%) were to developed countries.

**Table 6.** Summary of current and previous flags for large-scale tropical tuna purse seiners ( $\geq 335$  m<sup>3</sup> FHV).

		Current Flag	
		Developed	Other
Previous Flag	Developed	19	136
	Other	15	171

A considerable number of the large-scale tropical tuna purse seiners discussed in this section are registered in ISSF’s Proactive Vessel Register (PVR). ISSF created the PVR to give vessel owners an opportunity to identify themselves as active participants in meaningful tuna sustainability efforts. At the same time, the PVR provides validated information to tuna purchasers and interested stakeholders that reflects the positive steps each vessel is taking in implementing a series of commitments designed to improve tuna fishing practices (more info is at <http://iss-foundation.org/knowledge-tools/databases/proactive-vessel-register/>). The number of large-scale PS vessels targeting tropical tuna that have registered in the PVR keeps increasing. Specifically, 517 large scale purse seine vessels, with a combined FHV of 721,670 m<sup>3</sup> are now registered in the PVR; which represents 74% of the global fleet in number and an 83% in FHV of the total of 696 large scale purse seine vessels fishing for tropical tunas.

### 3.5.1. CHANGES SINCE 2019

Justel-Rubio and Recio (2019) estimated that there were 686 large-scale vessels fishing for tropical tunas in June 2019. The estimate of 696 in June 2020 represents a 1.5% increase. However, this increase is not all due to new constructions. **Table 7** summarizes all changes that took place since 2014.

Twelve recently constructed (between 2012 and 2020) large-scale vessels have been added to the tropical tuna authorized purse seine lists since June 2019 (**Table 7**). There are also 9 large-scale purse seiners that were constructed prior to 2012 which were not listed in the RFMO Records in June 2019 as they may have been inactive for some time or participating in a different fishery. There are 4 additional vessels that are now authorized by one of the tRFMOs but whose year of construction is unknown from public records. Using the available data, it is not possible to determine the fisheries in which those vessels not registered in tRFMO Records in 2019 participated before, if any.

As shown in [Section 3.2](#), there is considerable variability in the relationships between different vessel dimensions to estimate FHV and, hence, to determine whether a vessel is large-scale or not in terms of FHV. The tRFMO records are updated regularly, and reported dimensions can change, or missing dimensions can start being reported when they were not. Because of these newly reported data, a number of vessels were re-classified (**Table 7**), for example two vessels that were estimated to be large-scale in Justel-Rubio and Recio (2019) were no longer so in this study.

Several other factors explain the differences between the estimates in the previous snapshot (Justel-Rubio and Recio, 2019) and this study. Sixteen vessels either sank or somehow are no longer in the authorized vessels records of the RFMO (most of them were previously registered to the WCPFC and ICCAT). Additionally, thirty-five vessels changed name and/or flag (**Table 7**).

Without Unique Vessel Identifiers (UVIs), it is difficult to track vessel flag/name changes. Fortunately, the situation is improving since organizations like ISSF have been advocating for the use of UVIs such as the IMO number. The number of large-scale tropical tuna purse seiners with publicly known IMO numbers increased from 12% in 2011 to 99% in 2018. The percentage since June 2019 is 97%, but it may be higher, as it is unclear at the moment of writing this report whether some vessels newly registered at IOTC have IMO numbers or not. The four tropical tuna RFMOs (IATTC, ICCAT, IOTC and WCPFC) now require mandatory use of UVIs, such as IMO numbers.

**Table 7.** Changes between large-scale tropical tuna vessels estimated in consecutive versions of the snapshot.

### 3.5.2. VESSELS CONSTRUCTED IN RECENT YEARS

The number of large-scale tropical tuna purse seine vessels constructed during the 2014-2020 period according to tRFMO records is summarized in **Table 8**. It is worth noting that the total number of new vessels by year have significantly decreased since 2016 and that the majority of newly built vessels that have changed flags were initially flagged to Papua New Guinea.

**Table 8.** Large-scale tropical tuna purse seine vessels built in recent years (2014-2020) grouped by flag and development status of the flag states.

		2014	2015	2016	2017	2018	2019	2020

<sup>7</sup> These five vessels were initially flagged to Papua New Guinea

## 4. Conclusions

Using updated information available from both the tRFMOs and the supporting databases, we estimate that—in June 2020—there were 1,721 purse seine vessels authorized to fish for tunas worldwide, with a combined FHV of over 1,084,000 cubic meters. This represents a 7% decrease in the number of vessels since the previous snapshot report by Justel-Rubio and Recio (2019), due mainly to the removal of several vessels from the tRFMO authorized vessels lists, predominantly those of medium-small size and/or targeting bluefin tuna in the Atlantic ocean and Mediterranean sea. Restricting the list to large-scale vessels, defined here as  $\geq 335$  m<sup>3</sup> FHV, reduces the number of purse seiners to 787, with a combined FHV of over 921,000 m<sup>3</sup>.

Focusing on large-scale purse seine vessels that target tropical tunas brings the number down to 696 vessels with about 874,000 m<sup>3</sup> of combined FHV. Over twice as many of these vessels are flagged to developing countries than are flagged to developed countries. A large proportion of these vessels (74% in number, 83% in FHV) are registered in ISSF's Proactive Vessel Register. About 17% of these vessels are authorized to fish in two or more RFMOs, indicating a large potential mobility of these fleets at a global level. We recommend that RFMOs consider extending their authorized vessel records to include information about the RFMO area in which each individual vessel is active each year. This will facilitate the monitoring of active fishing capacity by region.

A comparison with last year estimates (Justel-Rubio and Recio, 2019), using updated data, shows that, once more, there were numerous changes in the tRFMO authorized vessel records (**Table 7**). Several vessels that appeared on the records in 2019 can no longer be found. Other (older) vessels that were not on the records are now listed, and some vessels changed in reported dimensions. The quality of the data in tRFMO records has been undoubtedly improving in recent years, but there are still substantial gaps and opportunities for improvement. We recommend that tRFMO members exercise greater quality control of the data they submit to the tRFMOs for the vessel records and that tRFMOs adopt vessel registry requirements that include quality control mechanisms.

Since Justel-Rubio and Recio (2019), 12 recently constructed (between 2012 and June 2020), large-scale purse seine vessels have been added to the tRFMO records.

# Recommendations

*This study resulted in three recommendations:*

## **Recommendation 1:**

- Owners of vessels of other eligible types and sizes (other than large-scale purse seine vessels) also apply for IMO numbers, given the utility of using IMO numbers as Unique Vessel Identifiers as a powerful tool to combat Illegal unreported and unregulated (IUU) fishing.

## **Recommendation 2:**

- Tuna RFMO members exercise greater quality control of the data they submit to the tRFMOs for the vessel records and tRFMOs adopt vessel registry requirements that include quality control mechanisms.

## **Recommendation 3:**

- tRFMOs maintain not only lists of vessels authorized to operate in the Convention Areas, but also maintain lists of vessels that are actively fishing in the Convention Areas, to make it possible to estimate active capacity by region in any given year.

## Acknowledgments

We would like to thank Víctor Restrepo and Hilario Murua for their useful reviews and valuable comments on earlier drafts of the document.

## Appendix 1. Glossary

**FCC.** Fish Carrying Capacity. The amount of fish, in tonnes, that a vessel can carry. This is related to the size of the fish wells. However, the actual tonnage carried may vary depending on the size of the fish and how they are stored. FCC is often measured as the maximum landings observed for a given vessel.

**FHV.** Fish Hold Volume: The total measured cubic content of the fish wells, in cubic meters.

**GRT.** Gross Register Tonnage: The total measured cubic content of the permanently-enclosed spaces of a vessel, with some allowances or deductions for exempt spaces such as living quarters (1 gross register ton = 100 ft<sup>3</sup> = 2.83 m<sup>3</sup>).

**GT.** Gross Tonnage: The volume of all ship's enclosed spaces (from keel to funnel) measured to the outside of the hull framing.

**LBP.** Length between perpendiculars: The length of a vessel (loaded) along the waterline from the forward surface of the stem, or main bow perpendicular member, to the after surface of the sternpost, or main stern perpendicular member.

**LOA.** Length overall: The maximum length of a vessel from the two points on the hull measured perpendicular to the waterline.

**RGL.** Registered length: The length of the vessel as registered with the national authorities. Different countries have different requirements, so RGL could be LOA, LBP, or other measurements.

## Appendix 2. Relationships between vessel attributes

### 1. GROSS TONNAGE VS LOA

#### a) GRT vs LOA

The relationship between GRT (tonnes) and LOA (m) estimated using a MLE approach followed a function of the form (Figure 1a):

$$\text{GRT} = 0.0497 * \text{LOA}^{2.3382} \quad \hat{\sigma}_*^2 = 1045.15 \quad \varphi = -3466.65 \quad (n=510, R^2=0.80)$$

There is considerable variability in the relationship, especially for the larger vessels.

**Figure 1a.** Relationship between GRT (tonnes) and LOA (m) and 95% confidence intervals.

#### b) GT vs LOA

The relationship between GT (tonnes) and LOA (m) estimated using a MLE approach followed a function of the form (Figure 1b):

$$\text{GT} = 0.0380 * \text{LOA}^{2.4789} \quad \hat{\sigma}_*^2 = 624.26 \quad \varphi = -6125.12 \quad (n=942, R^2=0.97)$$

LOA is more strongly correlated to GT than it is to GRT.

**Figure 1b.** Relationship between GT (tonnes) and LOA (m) and 95% confidence intervals.

## 2. FHV VS FCC

The relationship between FHV (m<sup>3</sup>) and FCC (tonnes) estimated using a MLE approach on the subset of IATTC vessels for which FHV values were verified was linear (**Figure 2**):

$$FHV = 1.2839 * FCC \quad \hat{\sigma}_*^2 = 19.83 \quad \varphi = -1679.53 \quad (n=277, R^2=0.95)$$

Fish Carrying Capacity and Fish Hold Volume are highly correlated.

**Figure 2.** Relationship between FHV (m<sup>3</sup>) and FCC (tonnes) and 95% confidence intervals.

### 3. FHV VS LOA

The relationship between FHV (m<sup>3</sup>) and LOA (m) estimated using a MLE approach on the subset of IATTC vessels for which FHV values were verified followed a power function of the form (**Figure 3**):

$$\text{FHV} = 0.3043 \cdot \text{LOA}^{1.9806} \quad \hat{\sigma}_*^2 = 688.13 \quad \varphi = -1727.30 \quad (n=259, R^2=0.89)$$

**Figure 3.** Relationship between FHV (m<sup>3</sup>) and LOA (m) and 95% confidence intervals.
